Abstract

The current study aims at identifying the psychological and physical effects caused by the spread of Corona pandemic on the mental health of Algerian individual. In order to achieve this purpose the descriptive analytical approach was employed as well as two methods of focus group and content analysis which were directed to different age groups (children, young people and the elderly). It was relied upon the interview as a study tool. The following results would be reached later:

- There is a set of psychological effects that the Corona pandemic left on the mental health of the Algerian individual (children, young people and the elderly). Those effects are represented by a group of psychological and physical symptoms.

Keywords: Mental health; Psychological symptoms; Physical symptoms; Corona pandemic.

Title: The mental health of the Algerian individual in light of the corona pandemic

الصحة النفسية للفرد الجزائري في ظل جائحة كورونا الملخص:

هدفت الدراسة الحالية إلى معرفة الآثار النفسية والجسدية والتي كان سببها انتشار وتأثير جائحة كورونا على صحة الفرد الجزائري. ولتحقيق هذا الهدف ثم توظيف المنهج الوصفي التحليلي واستخدام طريقي المجموعة البؤرية وتحليل المحتوى وتم التوجه إلى فئات عمرية مختلفة (الأطفال، الشياب، المسنين)، أما بالنسبة لأداة الدراسة تم الاعتماد على المقابلة، وليتم التوصل فيما بعد إلى العديد من النتائج مفادها وجود مجموعة من الآثار التي خلفتها جائحة كورونا على صحة الفرد الجزائري (الأطفال، الشباب، المسنين)، والتي تمثلت في مجموعة من الأعراض النفسية والجسدية.

الكلمات المفتاحية: الصحة النفسية العرض النفسي؛ العرض الجسدي؛ جائحة كورونا.

Introduction - problematic:

The most important thing that distinguished the world in 2019 was the spread of Corona pandemic, or what is known as the Covid 19 pandemic. The world is still under the control of this pandemic which has effects on all fields, economic, social, and health. The whole world is facing an unprecedented challenge with this unknown virus and rushing to contain it, especially after recording terrible numbers of deaths. According to local statistics on the Corona virus, the number of the estimated infections on July 21st, 2020 in Algeria is about 24,278 cases. Whereas, the

Abidi Sanaa sanaabidi@gmail.com

ISSN: 2170-1822, EISSN: 2600-6189	AlNaciriya: Journal of sociological and historical Studies
pp. 794 - 817	Vol 13 N° 01 June 2022 Title: The mental health of the Algerian individual in light of the corona pandemic

estimated number of deaths is 1,100. These numbers are constantly changing (from the electronic daily Elaph, 2020).

All these data and others, fear and the preventive measures to confront the crisis including the quarantine has changed the course of Algerians' lives due to social isolation and the lack of personal contact between individuals. In addition to, the great influence left by the with this health crisis in dealing unprecedented and intimidating presentation of the virus risks, especially with the first infection with it. All those factors have contributed in a way or another in affecting the mental health of individuals and the emergence of some psychological and physical effects (symptoms). This is what we have found in a recent study that was conducted in February 2020 by "Huang" and "Ning Chau". It took place in China and aimed to assess psychological risks and physical disorders resulting from the Corona virus. It is a study that assigned different prospective occupational groups. The study has concluded that the burden of mental health among health workers was high as a result of anxiety and depression symptoms. In addition the sleep hours among young people have been increased due to the outbreak of the pandemic (about the Future Center for Research and Future Studies, 2020).

The lack of local studies on the Corona virus and the effects it has on mental health of the Algerian individual due to the novelty of the phenomenon and the importance of treating it from a psychological point of view, has led us to conduct this study which includes the following research question:

What are the symptoms caused by the Corona pandemic on the mental health of the Algerian individual?

We will try to answer the following two main questions:

ISSN: 2170-1822, EISSN: 2600-6189	AlNaciriya: Journal of sociological and historical Studies
pp. 794 - 817	Vol 13 N° 01 June 2022 Title: The mental health of the Algerian individual in light of the corona pandemic

What are the psychological symptoms that a person experience because of Corona pandemic?

What are the physical symptoms that a person experience because of Corona pandemic?

Partial hypotheses

There are psychological symptoms that the Algerian individual experience as a result of the Corona pandemic spread.

There are physical symptoms that the Algerian individual experience as a result of the Corona pandemic spread.

The theoretical side

1-Definition of Covid 19:

Covid 19 is a disease caused by a new strain of Corona virus (Corona), and the English designation for the disease is derived as follows:

- -CO are the first two letters of Corona
- -VI are the first two letters of Virus

This disease was initially called the new Corona 2019. It is a new virus related to the family of the viruses which caused the syndrome disease that was behind the severe acute respiratory syndrome (SARS) and some types of common cold (UNICEF, 2020). The new name of the virus Covid (19) was approved by the World Health Organization on February 11th, 2020. This is based on the guidelines which are previously established by both the World Organization for Animal Health, Food and Agriculture Organization of the United Nations (FAO) (World Health Organization, 2020).

Covid-19 is an infectious disease that began its outbreak in the Chinese city of Wuhan in December 2019. It has now turned into a pandemic affecting the entire world. Among its most common symptoms are fever, dry cough and fatigue. Some patients may suffer from pains and aches, or nasal congestion, or throat pain. Some patients may be

الناصرية الناصرية Sanaabidi@gmail.com 2022 مجلد: 13 عند 10 جوان 797

ISSN: 2170-1822, EISSN: 2600-6189	AlNaciriya: Journal of sociological and historical Studies
pp. 794 - 817	Vol 13 N° 01 June 2022 Title: The mental health of the Algerian individual in light of the corona pandemic

infected, but their symptoms may be mild. About 80% of the contaminated recover without the need for treatment in hospital. However, the risk of severe complications increases in the elderly and people who have had previous health problems (World Health Organization, 2020).

2-Psychological health:

It has been mentioned in a definition of mental health of (Lauders et al., 1992)that is not a constant state but rather it is a state of balance between the physiological, psychological, social resources, mechanisms of protection, defence of the body on the one hand and the underlying disease-causing effects of the physical, biological and social surroundings from the other hand (Mr. Fahmy Ali, 2009, p. 25)

The World Health Organization considers mental health as an integral part of health. It identifies mental health as a state of well-being, happiness, physical, psychological and social adequacy. It is not merely the absence of disease (Boutros Hafez Boutros, 2008, p.29). Through this definition, we can rely on three basic points:

- 1- Mental health is an integral part of public health.
- 2- Mental health is more than just being unaffected.
- 3- Mental health is related to a range of behaviour and physical health.

It is clear from the above that this positive concept of health which considers mental health an integral part of it, confirms that health is not just a celebration of disease, but rather a state of adaptation and balance with oneself and with the human community as a whole. This is starting with the family.

However, this balance may be disturbed because health is not absolute. Either you are healthy or not. Mental health is similar to physical health. For example, the state of complete compatibility between the body parts is almost non-existent whereas, the degree of imbalance of this

الناصرية Abidi Sanaa sanaabidi@gmail.com 2022 مجلد: 13 عند 10 جوان 798

01 June 2022 nental health of the Algerian n light of the corona pandemic

compatibility is present. It makes the state of disease clearer than health.

So, mental health does not mean that there are boundaries between mental health and mental illness. It is certain that talking about mental illness leads us in one way or another to consider the next element when defining the symptom. It means that the individual's success in adapting to his environment is relative. This balance may be disturbed between the individual and his environment when the individual faces pressures and crises. Especially, if this crisis is represented by the Corona pandemic which threatens the life and health of all societies throughout the world as well as individuals of different age groups.

3-Display Definition:

Symptoms are behavioural signs indicating existence of a disease as well as the difference between normal and abnormal (pathological) personality in terms of symptoms which are different in degree and not type. Symptoms may be related to the body complaint (such as fever or headache), or psychological behaviour (such as laziness, lack of the desire to eat). They express the body's reaction to a disease-generating condition. The symptom is not a diagnosis by itself especially if it is alone. However, it takes the form of the disease if it enters into a logically consistent system with other symptoms. As the same symptom can be found within different psychological diseases or disorders which differ in terms of severity, origin and relative treatment as well. The therapist in this situation has to place the symptom within his correct frame and intent for the expected diagnosis (Idris Abdel Salam Shahidi Al Wazzani, 2008, p. 34).

Therefore, determining a specific symptom is the first step in the diagnostic path. For the event to be a symptom according to this path, it must constitute clinical stability and temporal stability. It is observed from time to time

الناصرية الناصرية Sanaabidi@gmail.com 2022 مجلد: 13 عدد 10 جوان 799

ISSN: 2170-1822, EISSN: 2600-6189	AlNaciriya: Journal of sociological and historical Studies
pp. 794 - 817	Vol 13 N° 01 June 2022 Title: The mental health of the Algerian individual in light of the corona pandemic

throughout the duration of the disease. The nature and quality of the symptoms are not dependent only on the characteristic of the disease-generating factor, but also on the psychological characteristics of the person concerned.

We may also point out that there is a group of symptoms and signs that are named the same as entire disorders. They contain among its components symptoms or signs, such as "anxiety" and "depression". Then, the use of these words must be distinguished when denoting symptoms of changes related to emotion. Those symptoms are found in many mental disorders when they are used to refer to disorders of the same name. Anxiety or depression is basic symptoms in a syndrome that includes a set of other basic symptoms. They are necessary to diagnose "anxiety disorder" or "depressive disorder."

Field side

- * **Approach**: The descriptive and analytical approach was adopted.
- * Research tools Many tools have been used to collect and analyze information, the most important of which are:
 - -Content analysis.
 - Focus groups.

Conduct the study with the focus group:

The procedural features of the Focus Group are considered a qualitative method of scientific research. This method aims to collect qualitative data on a specific topic by revealing perceptions and mutual agreements between the participating members. To achieve this method, we have followed the following steps which are briefly explained in the interpretation diagram of the focus group as follows:

1. Introducing the participants:

Focus	Focus	Focus	Focus	Focus
group 01	group 02	group 03	group 04	group 05

Abidi Sanaa sanaabidi@gmail.com 2022 جوان

ISSN: 2170-1822, EISSN: 2600-6189	AlNaciriya: Journal of sociological and historical Studies
pp. 794 - 817	Vol 13 N° 01 June 2022 Title: The mental health of the Algerian individual in light of the corona pandemic

10 cases	12 cases	08 cases	07 cases	09 cases

2. Set up a network or interview guide

Here we have prepared the focus group interview guide as a tool for gathering data and information:

This guide or network is the basis of discussion within the group, the grill is the support of group discussions. For some researchers, it is a tool to revive the dialogue.

The interview protocol for focus groups is as follows:

- 1- What are the psychological symptoms that you feel as a result of experiencing Corona pandemic?
- 2- What are the physical symptoms that you feel as a result of experiencing Corona pandemic?

3 Analysis and reporting the results

3-1 - The first focus group: frequency ≠ 45

pp. 794 - 817	Title: The mental health of the Algerian
	individual in light of the corona pandemic

- -Fear of infection with the Corona virus. -The emergence of excessive motor activity -Some anxiety nervousness Shortness of breath. -Numerous wounds, injuries, and delusional infection with the virus. -Cough -Cold -Increased heartbeat for fear of infection.
- 2- The psychological and (psycho-physical) effects of the Corona pandemic on young people in Algerian society, the most important of which are:
- *In girls:
- -Fear and extreme anxiety-Feeling constantly threatened
- -Feeling of psychological imbalance -Impact on household and intellectual chores -Some obsessions -Shortness of breath
- -Digestive problems -Sensation of a change in body temperature –Fatigue.
- * In young males:
- -Anxiety -Show indifference -Reduced personal freedom
- A sense of psychological insecurity resulting from fear of losing financial stability at the level of income (fear of a decrease or interruption of the monthly salary). -Digestive problems -Night insomnia Headache

4-3- The psychological and (psycho-physical) effects of the Corona pandemic on the elderly people in Algerian society, including

Fear of their children because of the possibility of transmitting infection. Delusion of the disease-Avoiding others

Some nightmares at night and day-Financial fear (fear of theiragility of the retirement fund)-Shortness of breathDigestive problems-Joint pain due to fear- Shivering, especially when hearing news of virus infections or deaths
Symptomatic disorder of chronic diseases (diabetes, blood pressure ...)-A sense of numbness -Fatigue and weakness
-Loss of appetite

Conclusion:

Finally, after the previously listed research stages and the results reviewed, it seems clear that the spread of the

pp. 794 - 817	Vol 13 N° 01 June 2022 Title: The mental health of the Algerian
	individual in light of the corona pandemic

Corona pandemic has had effects on the mental health of the Algerian individual of all ages (children, youth, and the elderly). Those effects are prevalent through psychological and physiological symptoms especially with the data that accompanied the spread of the phenomenon. This is due to its ambiguity and the lack of both scientific and medical research carried out about it and the health measures taken to confront it, especially the quarantine and the policy of social distancing. In order to contain these symptoms and prevent them from developing into complex mental disorders, it is useful to take a set of recommendations in order to deal with them wisely. They are included in the following: -Programming classes for psychologists to accompany the contaminated during the quarantine as well as programming citizens or a private channel to take care of them and talk to them to explain their psychological and physical conditions so that they can reassure them.

Citizens can seek psychological help through behavioural or cognitive therapy, or the practice of relaxation and some psychological treatments. This can be done via the Internet.

- Staying at home makes individuals, especially children, feel bored, anxious and depressed. Thus, it is necessary to maintain a timetable for practicing life activities under these circumstances. This could be achieved through maintaining bedtime and regular meals, playing some games with children and with the family in addition to practicing walking and sports in an open place.
